

Updating your software

Tips to safeguard your data and privacy

01. Search for updates

Routinely check your most used apps for new software updates. Doing so keeps your data protected with the latest protections built into the software

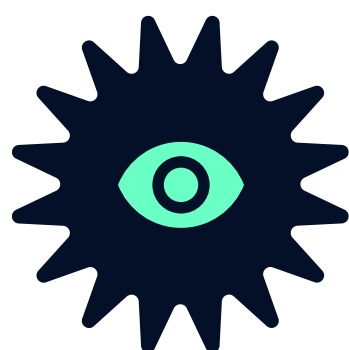

02. Verify the source of the update

Sometimes an update for your app can be published from an untrustworthy source. Make sure you are downloading software only from reputable vendors or the creator of the application itself

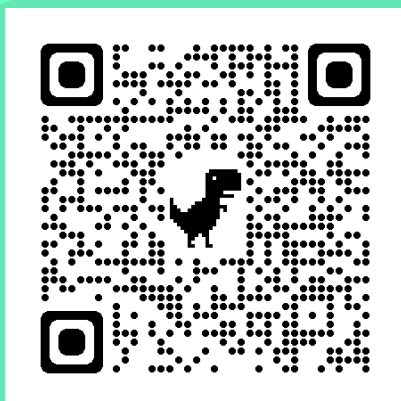

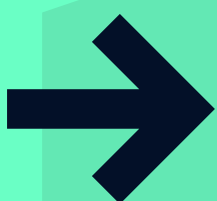

03. Turn on automatic updates

Often we can forget to keep our apps updated. Turning on automatic updates ensure we're always protected.

04. Don't fall for fakes!

Malicious scammers exist everywhere online who will send you ads saying your system is compromised. Don't fall for these fakes, known as phishing that only try to install malicious software into your system.
